

## Threads (Hilos)

## Procesos en un S.O.

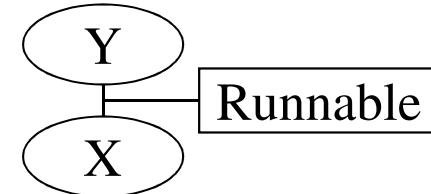

Objeto de  
subclase de Thread

```

class X extends Thread {
    .....
    public void run()
    { // código origen del hilo
    }
}
  
```

```
X a = new X(); a.start();
```

\*El start() puede situarse en el constructor

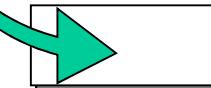

Objeto de  
clase Runnable

```

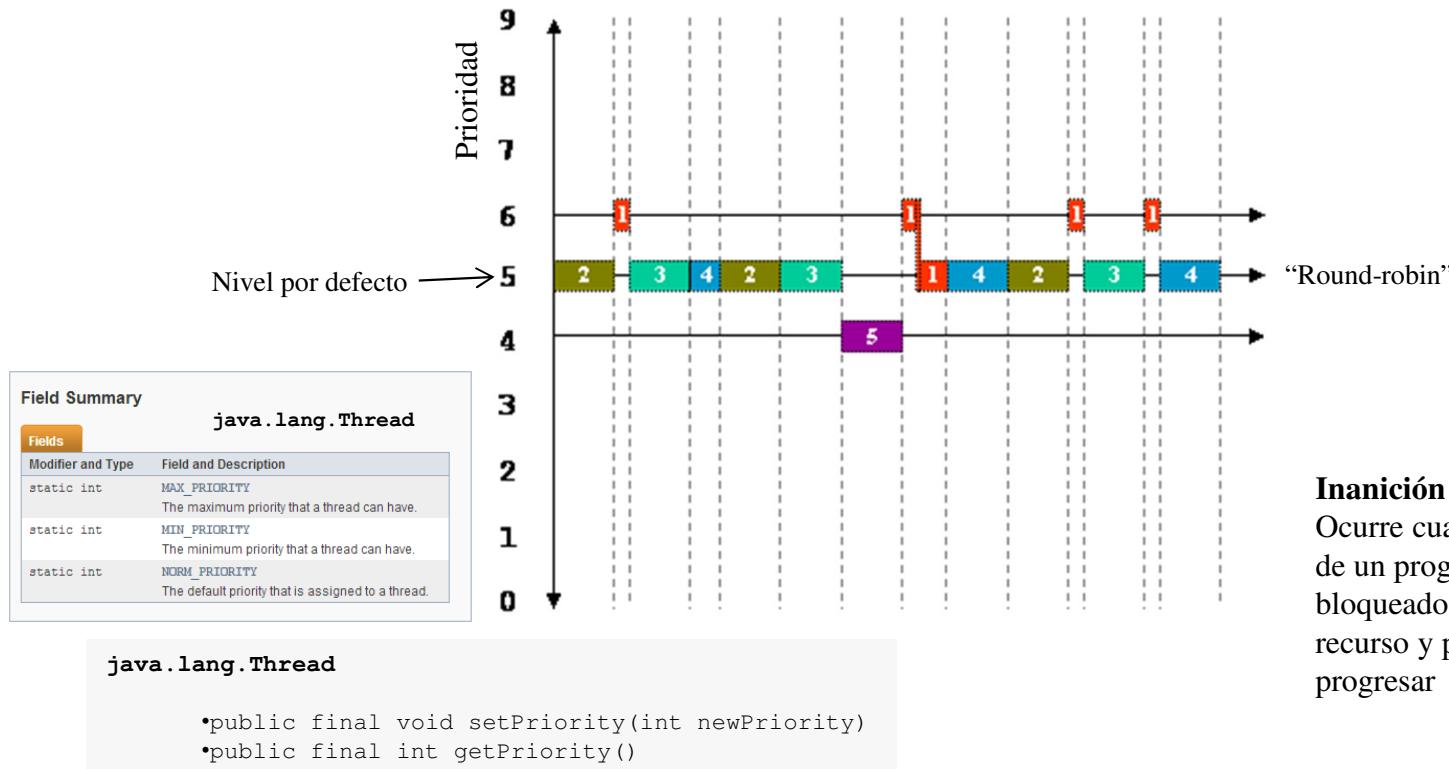

class X extends Y implements Runnable {
    .....
    public void run()
    { // código origen del hilo
    }
}
  
```

Objeto Thread

```
X a = new X(); Thread t=new Thread(a); t.start();
```

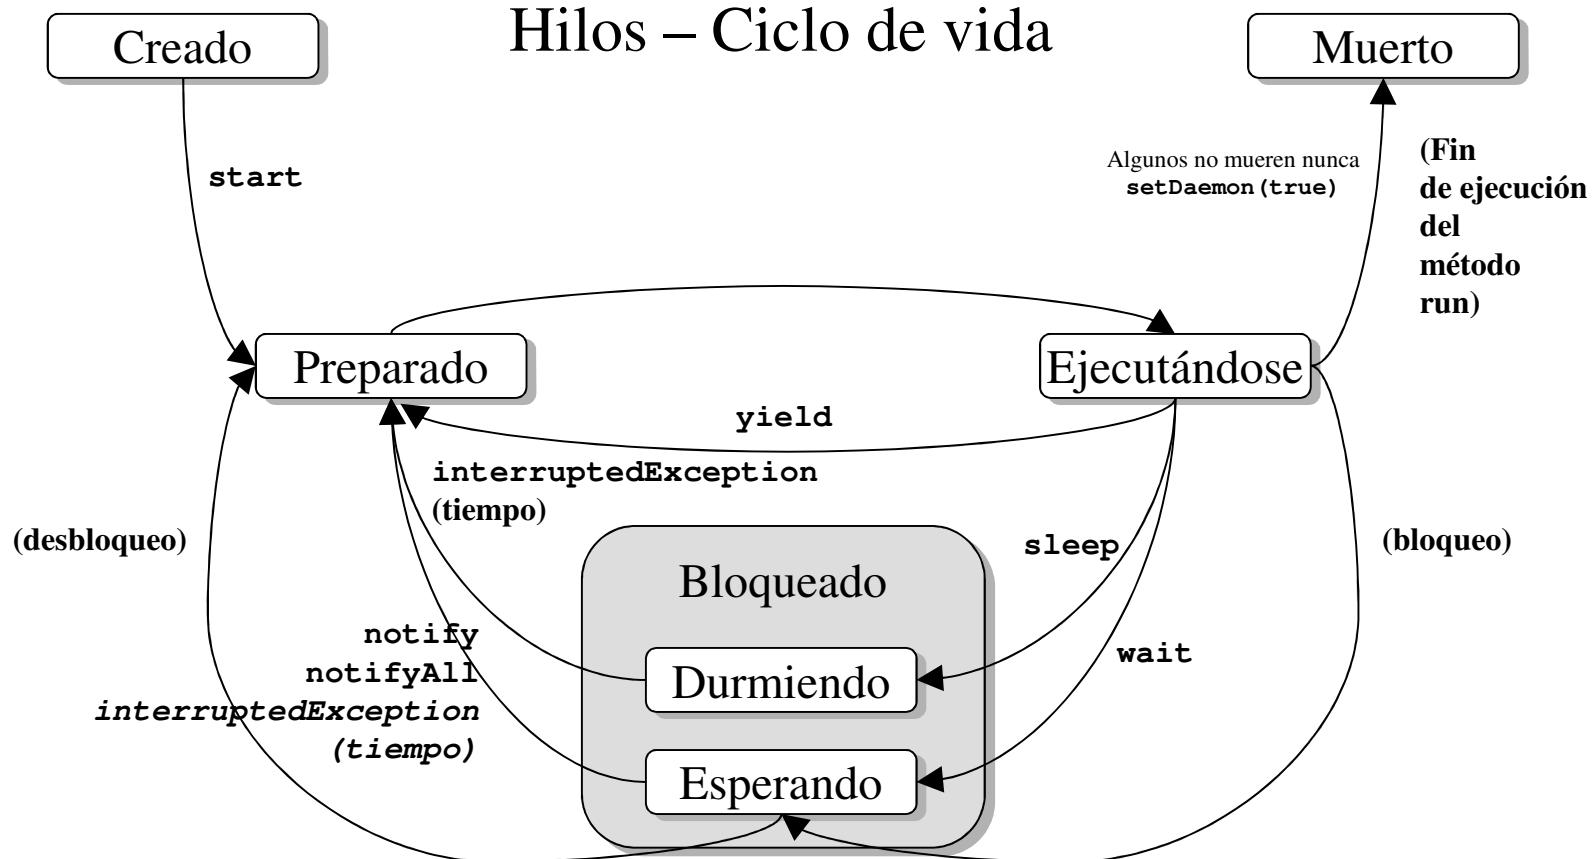

# Hilos – “Scheduling” asignación de tiempos y Prioridades

**Inanición (starvation)**

Ocurre cuando uno o más hilos de un programa ven siempre bloqueado su acceso a un recurso y por tanto no pueden progresar

# Hilos – Ciclo de vida

## `java.lang.Object`

```

void      notify()
Wakes up a single thread that is waiting on this object's monitor.

void      notifyAll()
Wakes up all threads that are waiting on this object's monitor.

void      wait()
Causes the current thread to wait until another thread invokes the notify() method or the
notifyAll() method for this object.

void      wait(long timeout)
Causes the current thread to wait until either another thread invokes the notify() method or the
notifyAll() method for this object, or a specified amount of time has elapsed.

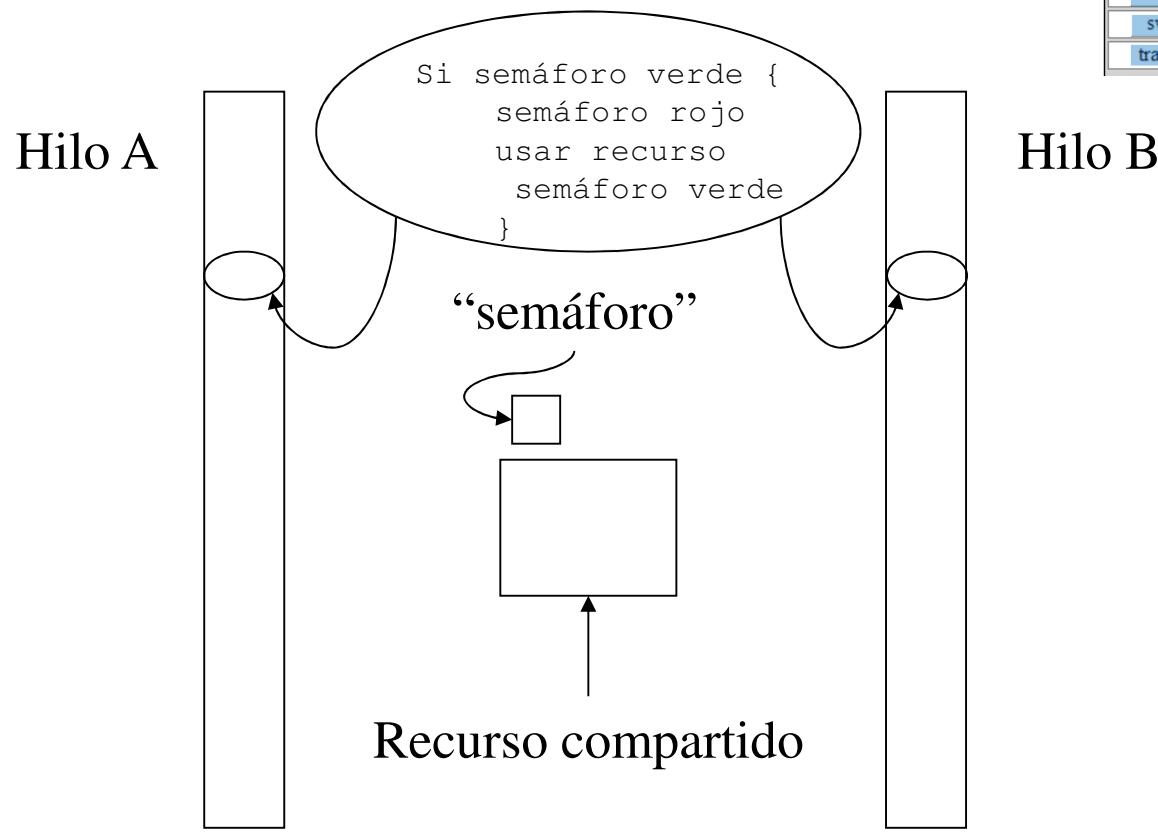

void      wait(long timeout, int nanos)
Causes the current thread to wait until another thread invokes the notify() method or the
notifyAll() method for this object, or some other thread interrupts the current thread, or a certain
amount of real time has elapsed.
  
```

<code>static void sleep(long millis)</code>	Causes the currently executing thread to sleep (temporarily cease execution) for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.
<code>static void sleep(long millis, int nanos)</code>	Causes the currently executing thread to sleep (temporarily cease execution) for the specified number of milliseconds plus the specified number of nanoseconds, subject to the precision and accuracy of system timers and schedulers.
<code>void start()</code>	Causes this thread to begin execution; the Java Virtual Machine calls the <code>run</code> method of this thread.
<code>void stop()</code>	Deprecated.
	This method is inherently unsafe. Stopping a thread with <code>Thread.stop</code> causes it to unlock all of the monitors that it has locked (as a natural consequence of the unchecked <code>ThreadDeath</code> exception propagating up the stack). If any of the objects previously protected by these monitors were in an inconsistent state, the damaged objects become visible to other threads, potentially resulting in arbitrary behavior. Many uses of <code>stop</code> should be replaced by code that simply modifies some variable to indicate that the target thread should stop running. The target thread should check this variable regularly, and return from its <code>run</code> method in an orderly fashion if the variable indicates that it is to stop running. If the target thread waits for long periods (on a condition variable, for example), the <code>interrupt</code> method should be used to interrupt the wait. For more information, see Why are <code>Thread.stop</code> , <code>Thread.suspend</code> and <code>Thread.resume</code> Deprecated?
<code>java.lang.Thread</code>	
<code>void stop(Threadable obj)</code>	Deprecated.
	This method is inherently unsafe. See <code>stop()</code> for details. An additional danger of this method is that it may be used to generate exceptions that the target thread is unprepared to handle (including checked exceptions that the thread could not possibly throw, were it not for this method). For more information, see Why are <code>Thread.stop</code> , <code>Thread.suspend</code> and <code>Thread.resume</code> Deprecated?
<code>void suspend()</code>	Deprecated.
	This method has been deprecated, as it is inherently deadlock-prone. If the target thread holds a lock on the monitor protecting a critical system resource when it is suspended, no thread can access this resource until the target thread is resumed. If the thread that resumes the target thread attempts to lock this monitor prior to calling <code>susume</code> , deadlock results. Such deadlocks typically manifest themselves as "frozen" processes. For more information, see Why are <code>Thread.stop</code> , <code>Thread.suspend</code> and <code>Thread.resume</code> Deprecated?
<code>String toString()</code>	Returns a string representation of this thread, including the thread's name, priority, and thread group.
<code>static void yield()</code>	A hint to the scheduler that the current thread is willing to yield its current use of a processor.

# Mecanismos proporcionados por Java para el entorno multi-hilo

- Exclusión mutua (secciones críticas)
- Bloqueo de recursos

Palabras reservadas en Java				
abstract	assert***	boolean	break	byte
case	catch	char	class	const*
continue	default	do	double	else
enum***	extends	final	finally	float
for	goto*	if	implements	import
instanceof	int	interface	long	native
new	package	private	protected	public
return	short	static	strictfp**	super
switch	synchronized	this	throw	throws
transient	try	void	volatile	while

**Interbloqueo (deadlock)** 

Es una forma “terminal” de inanición. Ocurre cuando dos o más hilos esperan a una condición que no puede satisfacerse. El interbloqueo más habitual consiste en que dos (o más) hilos esperan a que otro haga algo de un modo circular.

```
public class Cubiculo {  
    private int contenido;  
    private boolean disponible = false;  
  
    public synchronized int get() {  
        ...  
    }  
  
    public synchronized void put(int valor) {  
        ...  
    }  
}
```

## Sección crítica

wait / notify

```
public synchronized int get() {  
    while (!disponible) {  
        // esperar a que el productor genere un valor  
        try { wait(); } catch (InterruptedException e) {}  
    }  
    disponible = false;  
    // notificar al productor que el valor ha sido recogido  
    notifyAll();  
    return contenido;  
}  
  
public synchronized void put(int valor) {  
    while (disponible) {  
        // esperar a que el consumidor recoja un valor  
        try { wait(); } catch (InterruptedException e) {}  
    }  
    contenido = valor;  
    disponible = true;  
    // notificar al consumidor que el valor ha sido generado  
    notifyAll();  
}
```

```
public class Productor extends Thread {  
    private Cubiculo cubiculo;  
    private int numero;  
  
    public Productor(Cubiculo c, int numero) {  
        cubiculo = c; this.numero = numero;  
    }  
  
    public void run() {  
        for (int i = 0; i < 10; i++) {  
            cubiculo.put(i);  
            System.out.println("(" + numero + ") >> " + i);  
            try {  
                sleep((int)(Math.random() * 100));  
            } catch (InterruptedException e) {}  
        }  
    }  
}
```

## Productor / consumidor

```
public class Consumidor extends Thread {  
    private Cubiculo cubiculo;  
    private int numero;  
  
    public Consumidor(Cubiculo c, int numero) {  
        cubiculo = c; this.numero = numero;  
        setDaemon(true);  
    }  
  
    public void run() {  
        int valor = 0;  
        while (true) {  
            valor = cubiculo.get();  
            System.out.println(" (" + numero + ") << " + valor);  
            yield();  
        }  
    }  
}
```

# Comprobando el funcionamiento

```
public class MainProdCons extends Object {  
  
    public static void main (String args[]) {  
        Cubiculo cubiculo=new Cubiculo();  
        Productor p1=new Productor(cubiculo,1);  
        Productor p2=new Productor(cubiculo,2);  
        Productor p3=new Productor(cubiculo,3);  
        Consumidor c1=new Consumidor(cubiculo,1);  
        Consumidor c2=new Consumidor(cubiculo,2);  
        Consumidor c3=new Consumidor(cubiculo,3);  
  
        p1.start();  
        p2.start();  
        p3.start();  
        c1.start();  
        c2.start();  
        c3.start();  
  
    }  
  
}
```
