Peeking Ahead	PushbackReader	PushbackInputStream
Impresión	PrintWriter	PrintStream
Serialización de objetos		ObjectInputStream ObjectOutputStream

InputStream

```
int read()
int read(byte cbuf[])
int read(byte cbuf[], int offset, int length)
```

OutputStream

```
int write(int c)
int write(byte cbuf[])
int write(byte cbuf[], int offset, int length)
```

Reader

```
int read()  
int read(char cbuf[])  
int read(char cbuf[], int offset, int length)
```

Writer

Writer

```
int write(int c)  
int write(char cbuf[])  
int write(char cbuf[], int offset, int length)
```

```

import java.io.*;

public class Copy {
    public static void main(String[] args) throws IOException {
        File inputFile = new File("Entrada.txt");
        File outputFile = new File("Salida.txt");

        FileReader in = new FileReader(inputFile);
        FileWriter out = new FileWriter(outputFile);
        int c;

        while ((c = in.read()) != -1)
            out.write(c);

        in.close();
        out.close();
    }
}

```

Una simple copia de ficheros

Ejercicio:

Tomar nombres de ficheros
de la línea de invocación
del programa
(p.ej. java copy origen.zip destino.zip)

E/S de objetos

Tema: serialización

```

FileOutputStream out = new FileOutputStream("Tiempos");
ObjectOutputStream s = new ObjectOutputStream(out);
s.writeObject("Today");
s.writeObject(new Date());
s.flush();
-----
FileInputStream in = new FileInputStream("Tiempos");
ObjectInputStream s = new ObjectInputStream(in);
String today = (String)s.readObject();
Date date = (Date)s.readObject();

```

Serialización

```
package java.io;
public interface Serializable {
    // there's nothing in here!
};

-----
public class MySerializableClass implements Serializable
{
    ...
}

private void writeObject(ObjectOutputStream s)
        throws IOException {
    s.defaultWriteObject();
    // customized serialization code
}

-----
private void readObject(ObjectInputStream s)
        throws IOException {
    s.defaultReadObject();
    // customized deserialization code
    ...
    // followed by code to update the object, if necessary
}

-----
package java.io;
public interface Externalizable extends Serializable
{
    public void writeExternal(ObjectOutput out)
            throws IOException;
    public void readExternal(ObjectInput in)
            throws IOException,
                   java.lang.ClassNotFoundException;
}
```

Only the identity of the class of an Externalizable instance is written in the serialization stream and it is the responsibility of the class to save and restore the contents of its instances. The writeExternal and readExternal methods of the Externalizable interface are implemented by a class to give the class complete control over the format and contents of the stream for an object and its supertypes. These methods must explicitly coordinate with the supertype to save its state. These methods supersede customized implementations of writeObject and readObject methods.

Object Serialization uses the Serializable and Externalizable interfaces. Object persistence mechanisms can use them as well. Each object to be stored is tested for the Externalizable interface. If the object supports Externalizable, the writeExternal method is called. If the object does not support Externalizable and does implement Serializable, the object is saved using ObjectOutputStream.

When an Externalizable object is reconstructed, an instance is created using the public no-arg constructor, then the readExternal method called. Serializable objects are restored by reading them from an ObjectInputStream.

An Externalizable instance can designate a substitution object via the writeReplace and readResolve methods documented in the Serializable interface.

    int b = in.read();
    if (b != -1) {cksum.update(b);}
    return b; }

public int read(byte[] b) throws IOException {
    int len;
    len = in.read(b, 0, b.length);
    if (len != -1) {cksum.update(b, 0, len);}
    return len; }

public int read(byte[] b, int off, int len) throws IOException {
    len = in.read(b, off, len);
    if (len != -1) {cksum.update(b, off, len);}
    return len; }

public Checksum getChecksum() {return cksum; }
}

```

Una clase de utilidad fuera de los 4 sub-árboles estudiados

Constructor Summary

```
RandomAccessFile(File file, String mode)  
RandomAccessFile(String name, String mode)
```

Method Summary

```
void close()  
FileDescriptor getFD()  
long getFilePointer()  
long length()  
int read()  
int read(byte[] b)  
int read(byte[] b, int off, int len)  
boolean readBoolean()  
byte readByte()  
char readChar()  
double readDouble()  
float readFloat()  
void readFully(byte[] b)  
void readFully(byte[] b, int off, int len)  
int readInt()  
String readLine()  
long readLong()  
short readShort()  
int readUnsignedByte()
```

RandomAccessFile

Method Summary (cont.)

```
int readUnsignedShort()  
String readUTF()  
void seek(long pos)  
void setLength(long newLength)  
int skipBytes(int n)  
void write(byte[] b)  
void write(byte[] b, int off, int len)  
void write(int b)  
void writeBoolean(boolean v)  
void writeByte(int v)  
void writeBytes(String s)
